KICAD – PRINTED CIRCUIT BOARD DESIGN SOFTWARE

- KiCad is a suite of programs that give the user powerful tools to draw electronic circuits in schematic form, and create printed circuit layouts from them.
- KiCad was started in 1992 by a French university professor needing a teaching tool.
- KiCad is Open Source, and can be used on Windows, Linux or macOS platforms.
- KiCad is FREE!

TERMINOLOGY

- First, we need some definitions used in the Printed Circuit world.
- Through-hole (TH) vs. Surface Mount Devices (SMD)
- Symbols and Footprints
- Then, we need a circuit design to do something useful.

BOARD CONSTRUCTION

- Typical PCBs have two or more layers of copper separated by fiberglass resin.
- Two sided boards (or 2 layer) are commonly used, though with higher density pin counts found in CPU / FPGA devices, more layers are required just to gain access to all of the pins.
- Computer motherboards typically have 8 to 10 copper layers.
- Extra layers are commonly used as ground shields between signal layers, and for power rail distribution.

SOME DEFINITIONS

 Through-hole – Holes are drilled through the circuit board, in a size to accept the component leads. Multilayer boards will have copper plating inside the hole, connecting each desired layer.

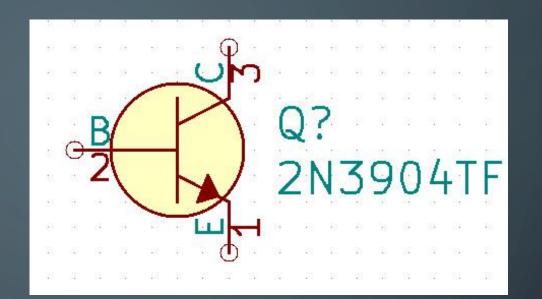

SOME DEFINITIONS

 Surface Mount – No holes for components. Components are soldered to pads on the board. Traces change layers using vias, which are small plated through holes.

SOME DEFINITONS – SYMBOLS

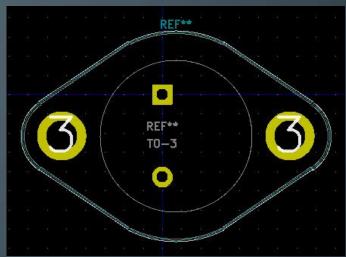

- This is a <u>Symbol</u> for an NPN transistor. The schematic will be drawn with symbols representing the parts you want to use. Resistors, Capacitors, Inductors, Semiconductors, all have recognizable symbols when drawn on a schematic diagram.
- It represents the function of the part, but not the physical design or package of the part.

SOME DEFINITIONS – THROUGH HOLE FOOTPRINTS

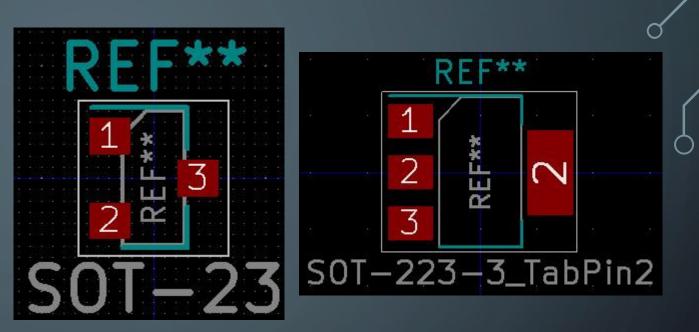

- These are all Through-hole <u>Footprints</u> for the same transistor Symbol. Each connection requires a tiny hole drilled through the board.
- It represents the physical design of the part and what it needs for connections on the printed circuit board. Footprints are always "TOP LOOKING DOWN".
- Symbols are associated with a specific Footprint. Though, you can have many similar symbols, each with a specific footprint depending on the package.

SOME DEFINITONS – SURFACE MOUNT

- These are Surface Mount Device (SMD) Footprints for the same transistor Symbol.
- It represents the physical design of the part and what it needs for connections on <u>one</u> <u>side</u> of the printed circuit board only. Surface mount parts <u>do not have holes</u> for the Pin connections.
- Surface Mount parts are typically much smaller than Through-hole devices. That is a benefit in RF designs as the extra capacitance due to the connection leads is minimized.

PICK A PROJECT AND DESIGN A BOARD!

- For this presentation, let's design something we might want to use in our shack.
- Lots of interest in IOT and Remote Control of devices.
- Design a power switching board that can handle the large current requirements of an 100 Watt HF radio, yet can be controlled by a low power device such as an Arduino or Raspberry Pi.

DEFINE THE CIRCUIT REQUIREMENTS

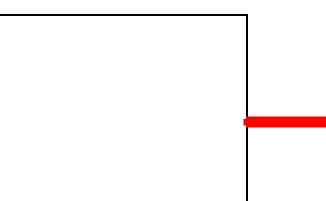

- Provide isolation between the IO pins and the device being controlled.
- Must be driven with a low voltage (Logic Level)
- Raspberry Pi / ESP32 IO pins are 3.3V, 17 to 40ma current sink/source maximum
- Arduino UNO/Nano IO pins are 5V, 20ma maximum sink/source.
- Typical Relays having large contacts require 100 mA or more for the coil.

Clearly, we can not drive a relay directly from an IO pin!

GET STARTED

 Download and install the KiCad installer appropriate for your Operating System from https://kicad.org

AFTER THE INSTALLATION IS COMPLETE

- The KiCad Suite has multiple programs that work together.
- You can access them from the KiCad project manager application.
- Find this Icon and Iaunch it.

KICAD PROJECT MANAGER

R

Each Icon represents a separate program or module of KiCad.

You will use the Schematic Editor and the PCB Editor the most.

DRAW THE SCHEMATIC IN KICAD

- We need to define the circuit in KiCad. We do this by drawing the schematic in the Schematic Editor.
- This defines all of the connections between each component. We need that before designing the actual Printed Circuit Board (PCB)
- If not for anything else, you can use KiCad to draw nice, pretty schematics.
- In the KiCad Launcher, click on the Schematic Editor Icon.
